Abstract

For this project we focused on how users engaged with TRI's website by analyzing data from Google Analytics, Google Tag Manager, and Squarespace. The purpose of this project was to identify patterns in user behavior, acquisition overview, demographics, and landing page performance to inform a strategy that supports TRI's mission and growth. We gathered data from the beginning of February to understand user activity, site performance, and where users were active and new users were coming from. Based on the data it was revealed that the majority of TRI's incoming users are female, aged 25-44, and located in the United States, with most of the landing pages focus on TRI's training courses. Organic and Direct traffic were ranked the highest for the acquisition channels, with potential growth from social and paid search. Moreover, we discovered the average amount of time each user spends on a certain landing page and the average amount of time based on how the user got to the landing page. Overall, our findings help TRI when it comes to the recommendations to improve TRI's SEO practices.

Introduction

For our topic we were focused on data analytics looking at Google Analytics, Google Tag Manager and Squarespace data for TRI goals, focusing on the main goal from Fall semester 2024 was wanting to promote their trainings especially TRM. For this semester the goal was to see how users were engaging with TRI's website. The importance of our topic it allows us to research how their users are coming to their website, what pages they are going to land, demographics, user behavior and acquisition overview. This report covers data gathered from Google analytics and Squarespace to provide us with details on user and acquisition overviews, as well as demographics, age, countries, etc. We also provide some key insights and findings in our reports and recommendations to help TRI with their digital strategies.

Related Works

The user analytics and search data reveal clear opportunities for optimizing content, SEO, and user engagement strategies. High-performing branded keywords show strong interest from returning users, suggesting brand trust and loyalty, while low CTRs for generic terms highlight gaps in content alignment and awareness-building for new users. Platforms like Google Analytics and GA4 allow for granular insights into user behavior, enabling organizations to track page views, engagement events, and conversion metrics—essential for digital optimization (Clifton, 2020; Google, 2023).

Industry best practices in SEO emphasize matching content to user intent, refining metadata, and structuring information to enhance visibility and click-through (Moz, 2024). Advertising trends support the need for segmentation and retargeting, particularly through remarketing campaigns aimed at professional learners and curious newcomers who show early interest but low conversion (WordStream, 2023).

To bridge the gap between awareness and action, analytics tools can help segment audiences, identify behavioral patterns, and drive content personalization. Ultimately, using tools like Hotjar and Google Tag Manager can support full-funnel strategies by identifying where users disengage and guiding redesign efforts that prioritize clear calls-to-action and educational content. Together, these approaches form a data-driven foundation for scaling impact and improving outcomes across digital platforms.

Research Questions

Group 1: What trends in user behavior and conversion can be identified over the past 12 months?

Q: Major demographic details

A: Based on the user data provided, the primary demographic insight is a strong geographic concentration in the United States, which accounts for 674 users — by far the largest share. Secondary

audiences include users from the United Kingdom (34 users), Canada (30), and the Philippines (13). While TRI has a globally dispersed user base, the data clearly shows that engagement is heavily focused on North America. This suggests that most users are likely either located where the organization already has established programs or where English-language trauma training resources are in high demand. Despite smaller numbers, the presence of international users highlights opportunities for growth in countries where awareness of CRM/TRM may emerge. These insights suggest that regional customization — such as time zone-aware event listings, local testimonials, or country-specific outreach — could deepen engagement with non-U.S. users while sustaining the strong base in the U.S.

Q: Where the audience came from

A: The audience primarily arrived through organic channels, as evidenced by the large number of page views (3,307), user engagement events (3,030), and session starts (1,447). These numbers point to strong discovery behavior — users are actively navigating the site, indicating that many are finding it through search engines or linked content. The most visited pages include the homepage, CRM and TRM program pages, the “Find a Training” page, and the iChill app page, showing that visitors are particularly interested in learning about available programs and tools. However, conversion events remain very low, with only 9 form submissions and 24 file downloads, indicating that while users are arriving and engaging, they are not taking final action. This suggests a large share of the audience is in the early stages of their journey — likely seeking information rather than ready to commit to registration or purchases. High interest in upcoming training events also implies that users are drawn by specific dates or offerings but may need more motivation or clarity to complete signups.

Q: Age range, gender

A: Female, Age 25-34 to be ranked the highest. With the unique age of 18-24 having the third highest count. (saw this in the age and gender section just wanted to add this if they want to know the most popular and the unique age to look at especially for the younger audience as they are likely to be new college graduates who possibly have a degree in psychology and are looking for extra credentials to have for their degree-Matthew)

Q: Acquisition traffic

A: Feb 1 – Apr 30, 2.3k active users and 2.1 new users, most active days were Apr 23-24 with 57, based on the days we see the trend where more users go to TRI site middle of the month towards the end \]=[of the month and we see some lows at the beginning of the month.

(Figure A1)

(Figure A2)

For Session, Organic Search was ranked number 1 during the 3 months with a total of 2.2k, Direct 1.5k. notable mentions of paid search as we believe Google Ads were rolled out around this point in time. Other mentions are from organic social meaning people from social media pages are coming to the site and any email newsletters that had gone out show users are finding ways to the site without having to organically search for it.

Session primary...Channel Group		↓ Sessions	Engaged sessions	Engagement rate	Average engagement time per session	Events per session	Event count All events	Key events All events	Session key event rate All events
Total		4,100 100% of total	2,423 100% of total	59.1% Avg 0%	57s Avg 0%	6.54 Avg 0%	26,830 100% of total	0.00	0%
☒	1 Organic Search	2,247 (54.8%)	1,367 (56.42%)	60.84%	58s	6.68	15,020 (55.98%)	0.00 (-)	0%
☒	2 Direct	1,474 (35.95%)	840 (34.67%)	56.99%	58s	6.30	9,290 (34.63%)	0.00 (-)	0%
☒	3 Referral	208 (5.07%)	137 (5.65%)	65.87%	57s	6.56	1,365 (5.09%)	0.00 (-)	0%

☐	7 Email	10 (0.24%)	3 (0.12%)	30%	10s	5.90	59 (0.22%)	0.00 (-)	0%

(Figure A3)

The new user helps too with TRI goals with Google Advertisement as we had 17 new users come through paid search and having organic search ranked number 1 with 1.1k users and direct with 822 users

Q: Pages they landed on and how much time they spent on it and which page generated the most traffic

A: Landing page is crucial too as this helps us with TRI original goal of promoting TRM training as we see the landing page for trm, and trm-trainings are being looked at with having an average of 15k-16k users going to that landing page.

New users by First user primary channel group	
FIRST USER PRIMARY CHA...	NEW USERS
Organic Search	1.1K
Direct	822
Organic Social	75
Referral	73
Paid Search	17
Unassigned	4
Email	2

/	28K
/crm-trainings	24K
/crm-teacher-training	20K
/trm-trainings	16K
/trm	15K
/tri-staff	11K

(Figure A5)

Overall, the average amount of time spent TRI page across all median channels is 57 seconds with direct having the highest at 58 seconds. For the certain pages focusing on the trm and trm-trainings we see users spend around 1 minute and 52 seconds for trm-trainings and for trm with an average of 1 minute and 18 seconds.

Landing page + query string +		Organic Google Search clicks	Organic Google Search impressions	Organic Google Search click through rate	Organic Google Search average position	Active users	Engaged sessions	Engagement rate	Average engagement time per active user	Event count All events	Key events All events	Ad revenue

(Figure A6)

Methodology & Data Analysis

Data Sources and Tools

The data for this analysis was obtained using Google Analytics, focusing on user behavior, engagement events, and acquisition channels. Data was exported into Excel and analyzed using Python and Excel for visualization and insights.

GA4 was used to extract data for

- User Demographic (Gender, Country, and age)
- Events (Events, Page and Screens, and landing page)
- User Acquisition (User Acquisition, Traffic Acquisition)

Data analysis

1. User Demographic

- Gender

(Figure B1)

The "Gender" graph provides information on user involvement and distribution by gender. Due to privacy settings or gaps in data collection, a sizable majority of users—1,752 out of roughly 2,000—are classified as "unknown," suggesting little demographic visibility. In addition to having the highest average interaction time per active user at 146.5 seconds, female users (366) exceed male users (156), while unknown users only have 93.0 seconds. This indicates that although there are fewer female users, they are far more active, spending almost 57% more time than the typical unknown user. The information points to a potential opportunity: increasing the quality of gender data may improve targeting, and enhancing the experience for active female users may increase interaction and retention even further.

- Active user vs Age

(Figure B2)

The "Active User vs. Age" graphic shows an important gap in the distribution of users and the completeness of the data. With 1,826 active users (more than 80% of the total), the "unknown" age group dominates, indicating a serious constraint in age monitoring, most likely brought on by privacy settings, cookie restrictions, or inadequate demographic data collecting. The age groups with the most activity among the known age groups are 25–34 (111 users) and 35–44 (109 users), closely followed by 18–24 (97 users). This shows that, when age is known, the primary audience that is engaged is between the

ages of 18 and 44, which is often regarded as the ideal demographic for digital consumers. Minimal participation from older age groups, particularly those aged 55–64 and 65+, may indicate poor outreach or interest from those groups.

Overall, the significant amount of unknown individuals highlights the need for improved demographic identification to enable more tailored content and advertising techniques, even though engagement seems to be highest among younger users.

Countries

New Users vs. Countries

(Figure B3)

According to the "New Users vs. Countries" figure, the user base is extremely focused on with the United States accounting for over 87% of all new traffic and the vast majority of new users (1,684 out of roughly 1,927 total). This suggests that current SEO, content, and marketing tactics are highly suited to a U.S. audience. Canada (54 users) and the United Kingdom (93 users) following far behind, indicating some global reach but little influence. With less than 30 users per, other nations like the Philippines, India, and Australia exhibit poor user acquisition. Furthermore, nations like Germany, Iceland, and Ireland record extremely little traffic—each with fewer than 10 users—which suggests either a lack of global exposure or regional hurdles.

Overall, the chart suggests a strong U.S.-centric digital presence with growth opportunities in English-speaking and mobile-heavy international markets, especially the UK, Canada, and parts of Asia.

2. Events

- Events

Event Count and Total Users

(Figure B4)

The "Event Count and Total Users" figure illustrates how users engage with the website's various components. With 2,209 users and 9,210 logged activities, `page_view` is the most frequent occurrence, suggesting high content visibility. Additionally, there are a lot of user engagement events (8,542 events for 2,138 people), which indicate that users are actively interacting with the site by clicking, scrolling, and browsing further. Surprisingly `session_start` (3,940 occurrences) nearly matches its user count (2,197), indicating that many users started more than one session. The ratios of events count to users for events like `first_visit` and `scroll` are closer (2,086 and 2,085 for `first_visit`, respectively), suggesting that these are usually just one event per user. The `scroll` event (1,678 actions from 949 users) implies that nearly half the users actively scroll, which is a sign of content engagement in depth.

Overall, the data suggests high user interaction and retention, with many users performing multiple actions per visit—an encouraging sign for engagement quality and content effectiveness.

- Page and Screens

Page and Screens

The site's most popular and frequently used pages are clearly visible in the "Page and Screens" chart. The homepage (/) is the main entry point and a high-traffic center, as evidenced by its 1,517 views and 722 active users. Then, /find-a-training (688 views, 423 users), /crm (635 views, 457 users), and /ichill

(526 views, 348 users) all perform well, indicating that they are important content sections that visitors find useful or interesting. It's interesting to note that there are almost as many active users on the /crm page as views, suggesting that users are actively participating—they are not merely clicking. Pages with lower views and active users, such as /crm-trainings, /trm-trainings, and /tri-staff, may indicate reduced visibility or user interest.

Overall, the data suggests the site is effectively channeling traffic to its core content pages, but there's potential to optimize lower-traffic sections through better navigation, promotion, or content updates.

- Landing Page

(Figure B5)

The pages that brought new users to the website first are shown in the "Landing Page New Users" chart. With 486 new users, the homepage (/) is the most popular entrance point. Following these are /crm (394), /ichill (300), and /trm (194 new users), suggesting that these pages are not only highly visited but also successful at drawing in new visitors. However, much fewer new users are drawn to specialist pages like /trm-trainings (54), /find-a-training (60), /crm-trainings (33), /crm-teachers (47), and /tri-staff (44). This significant decrease implies that these deeper pages are either not as well-known or are not often found through search engines or direct recommendations.

To maximize user acquisition, consider optimizing landing content and SEO for lower-performing pages or ensuring high-interest pages guide users deeper into the site through well-placed CTAs and navigation.

3. User Acquisition

- User Acquisition

(Figure B6)

The “Total, New Users and Returning Users” chart visualizes how users arrive at the site across various acquisition channels and distinguishes between new and returning visitors. **Organic search leads all categories** by a wide margin, with over 1,100 total users, most of whom are new demonstrating the strength of your SEO efforts in bringing in first-time traffic. **Direct traffic** is the next major contributor, with a noticeable portion of returning users, suggesting brand recognition or repeat visits from bookmarked links.

Organic social, referrals, and unassigned sources contribute far fewer users, with organic social showing minimal retention—highlighting a major gap in social media effectiveness. Channels like **paid search** and **email** register almost no activity, suggesting these campaigns are either inactive or underperforming.

The steep drop-off after the top two sources shows a **heavy reliance on organic and direct traffic**, with limited diversification. To reduce dependency and grow consistently, efforts should focus on strengthening **referral, email, and social strategies**, while also tracking underperforming paid efforts for potential optimization or reinvestment.

- Traffic Acquisition

(Figure B7)

The “Session, Engaged Sessions, and Engagement Rate” chart provides valuable insight into how different traffic sources perform not just in attracting visitors, but in keeping them meaningfully engaged. **Organic Search stands out**, generating over 2,000 sessions and about 1,300 engaged sessions, confirming it as the most impactful channel in both reach and quality of user interaction. **Direct traffic** follows with strong numbers, though slightly lower engagement, suggesting users who already know the brand but may be less actively interacting per visit.

After the top two sources, performance drops sharply—**Referral, Unassigned, Organic Social, Paid Search, and Email** all show minimal session and engagement volume. Notably, the **Engagement Rate (in yellow)** remains nearly flat across sources, indicating relatively consistent but modest engagement efficiency regardless of traffic type.

This chart suggests a clear **reliance on Organic Search for both quantity and quality**, while other channels underperform, possibly due to lack of targeting or underdeveloped campaign strategies. To improve engagement diversity and mitigate risk, you should focus on refining referral content, enhancing social media messaging, and evaluating paid and email channels for reactivation or optimization.

Discussion of Findings & Insights

1. User Behavior Trends and Conversion Insights

The website of TRI delivered robust new user access and returning user numbers leading to 2,100 new users and 582 returning users that generated a 27.7% retention rate in 90 days. The website reflects an on-target return visitor percentage compared to industry norms that focus on 20–40% for nonprofits and education sites (Teson, 2021). The current findings show promise yet indicate a need for creating methods that encourage users to return which should include regular email communications and content revisions. The highest interactions within events data showed these three user activities:

- Page Views (9,210)

- User Engagement (8,542)
- Session Starts (3,940)
- First Visits (2,086)

3. Events

	Event Count	Total Users
page_view	9,210	2,209
user_engagement	8,542	2,138
session_start	3,940	2,197
first_visit	2,086	2,085
scroll	1,678	949

(Figure C1)

Standard engagement goals in digital strategy show alignment with the metrics that demonstrate excessive user interaction beyond basic page counts. Data from Scroll events (1,678) occurred only for 949 users who comprised less than half of the total users indicating minimal page scrolling behavior that might indicate ineffective content for driving deeper user engagement. The analysis revealed that user behaviors and interactions occurred with regular frequency during the weekdays according to the available data. A notable traffic surge appeared on April 29 which crossed both channels and events probably resulted from a promotional campaign.

2. Demographic Overview

8. Demographic: Age

Age	Active users	Engagement rate	Average engagement time per active user
unknown	1826	0.58	97.34
25-34	111	0.59	81.31
35-44	109	0.63	121.79
18-24	97	0.61	148.42
45-54	72	0.62	115.11
55-64	41	0.79	110.73
65+	32	0.59	184.84

(Figure C2)

The recognized majority of users fell within the age range of 25–34 years with second and third highest usage rates posted by the groups of 35–44 and 18–24 years. The data shows that the 55–64 audience segment produced the most engagement at 0.79 percent yet the age group 65+ spent the greatest amount

of time engaged for 184.84 seconds. It is noted that online users who are older than the typical internet user show focused behavior by spending extensive amounts of time on personal content. A large knowledge gap existed in understanding user demographics because the 1,826 participants in the “Unknown” category presented limited information. The implementation of consent-driven analytic tools for improving data collection may help reveal such users so content can be personalized accordingly for future reference.

3. Geographic Reach and Performance

7. Demographic details: Country

Countries	New Users	Engagement Rate
United States	1,684	58.16%
United Kingdom	93	61.76%
Canada	54	53.41%
Philippines	30	72.97%
India	23	70.97%
Australia	14	72.22%
Germany	10	71.43%
Iceland	10	68.75%

Ireland	9	78.57%
---------	---	--------

(Figure C3)

Despite leading the United States with 1,684 new users it showed a moderate engagement rate of 58.16% compared to other smaller user bases:

- Ireland (78.57%)
- Philippines (72.97%)
- India (70.97%)

The research indicates that countries showing robust interest in TRI content operate in newborn or specialized international markets. The organization should increase its present commitments to regions with high levels of engagement by establishing partnerships or developing localized content and campaigns.

4. Traffic Acquisition and Source Performance

2. Traffic acquisition

	Session	Engaged Sessions	Engagement rate
Organic Search	2,168	1,313	60.56%
Direct	1,433	797	55.62%
Referral	197	129	65.48%
Unassigned	101	5	4.95%
Organic Social	84	59	70.24%
Paid Search	33	9	27.27%
Email	9	2	22.22%

(Figure C4)

Graphs for TRI (Feb 2 to Apr 29)

As per Apr 29 (07:25 PM)

1. User Acquisition

	Total	New Users	Returning Users
Organic search	1,154	1,110	301
Direct	890	799	242
Organic Social	75	75	3
Referral	73	71	17
Unassigned	41	4	0
Paid Search	17	17	0
Email	2	2	0

(Figure C5)

Organic Search emerged as the top-performing acquisition channel:

- 1,154 users (1,110 new)
- Engagement rate: 60.56%
- Sessions: 2,168

The high SEO effectiveness demonstrates that users find TRI through appropriate keyword queries in search engines.

The number of users who type or bookmark the TRI URL directly made up 890 of all visitors since direct traffic was the second most common method of access. In total 75 users accessed TRI through Organic Social but they produced a peak 70.24% user interaction rate compared to other sources demonstrating that social media platforms attracted very dedicated users. The engagement ratings among referral sources reached 65.48% which shows solid evidence of good-quality partnerships.

The performance of Email and Paid Search campaigns differed from the rest of the group by showing less success during the period.

- Email: 2 users, 22.22% engagement rate
- Paid Search: 17 users, 27.27% engagement rate

Industry benchmark data from (Bolling, 2024) indicates that the average email engagement rate rests between ~66% so the poor 22.22% and 27.27% performance levels indicate insufficient campaign targeting or inadequate optimization.

5. Landing Page and Content Performance

The most visited and landed on the page was the Homepage:

(Figure C6)

- 1,517 views
- 486 new users
- Average engagement time: 43 seconds

This is certainly typical homepage performance but a shorter engagement time than most other pages would indicate that users may be skimming their way through other sections.

Pages with strong engagement included:

5. Landing Page

	New Users	Average engagement time per session
/	486	1m 11s
/crm	394	1m 16s
/ichill	300	34s

/trm	194	1m 04s
/trm-trainings	54	51s
/find-a-training	60	1m 17s
/crm-trainings	33	1m 08s
/crm-teacher-training	47	2m 25s
/tri-staff	44	1m 52s

(Figure C7)

- /crm-teacher-training: 2m 25s
- /tri-staff: 1m 52s
- /find-a-training: 1m 17s

If these pages are more content-rich, or high intent, they would probably be staff directories or the in detailed training information. But note that even though they had fewer new users, these pages kept the user's attention for a longer time — suggesting, potentially, how to boost traffic to the high-engagement pages with internal linking or homepage restructuring. Though 300 new users played on the /ichill page, it had one of the least amount of engagement times (34 seconds). This suggests that users are not engaging with the content as they should and we may want to consider advising new content or content overhaul, perform an A/B testing or improve the usability of the content.

6. What's Working, What Isn't, and Recommendations

What's Working:

- Organic Search is extremely effective (Organic Search leads acquisition and engagement).
- Targeted content pages such as CRM training and staff pages have much user engagement.
- Although it still has a low volume, there's traffic coming from the social and referral channels of medium quality.

What's Underperforming:

- Returning User Rate is lower than nonprofit benchmarks (27.7%) (aimed at 30%) (Teson, 2021)
- Traffic and engagement are not being contributed by Email and Paid Search channels.
- Some of the associated landing pages such as /ichill are not keeping the users engaged.

What Needs to Change:

- Improve underperforming (or poorly performing) (e.g., /ichill, /trm-trainings) landing pages with content adjustments or tests.
- Using personalization in emails and targeting it better.
- To boost the visibility of our high engagement pages /crm-teacher-training and /tri-staff.
- If it won't come to you, retargeting campaigns or remarketing tactics will bring returning visitors and hike retention.

7. Comparison to Industry Benchmarks

(Figure C8)

Metric	TRI	Industry Average (Nonprofit/Education)	Source
Returning User Rate	27.7% ($582 \times 100 / 2100$) (Figure 8)	20%–40% (Aim 30%)	(Teson, 2021)
Engagement Rate (Organic Search)	60.56% (Figure 4)	~66%	(Bolling, 2024)
Email Open Rate	22.22% (Figure 4)	28.59%	(Jarvis, 2025)
Average Session Duration	Varies (29s–2m25s) (Figure 6)	2-3 mins	(Bolling, 2024)

(Figure C9)

Overall, TRI's website appears to show a great trend in acquiring and engaging in organic and direct channels. Yet, to make or exceed benchmarks and further fuel long-term impact, email strategy improvement and landing page design, as well as returning user engagement improvement, are suggested. Data-informed and practice-aligned, these changes could help position TRI to build deeper rapport with its audience and scale its mission to more persons.

Recommendations (Saurabh)

Based on the findings, here are **five actionable, evidence-based recommendations** to improve TRI's digital strategy:

1. Optimize Landing Pages for Higher Conversions

- **Problem:** High traffic to TRM/CRM training pages but low conversions (e.g., only 9 form submissions).
- **Solution:**
 - Redesign landing pages with clear, compelling **calls-to-action (CTAs)** (e.g., "Register Now" buttons above the fold).
 - Add **trust signals** (testimonials, certification badges) and simplify forms to reduce friction.
 - Use **A/B testing** to determine the most effective layouts (tools: Google Optimize, Hotjar).

2. Enhance SEO for Underperforming Keywords

- **Problem:** High-impression keywords (e.g., "resiliency," "trauma training") have **0% click-through rates (CTR)**.
- **Solution:**
 - Rewrite **meta titles/descriptions** to align with search intent (e.g., change "Resiliency" to "Trauma Resilience Training Programs").
 - Create **dedicated landing pages** for high-potential queries (e.g., "CRM certification for therapists").
 - Publish **blog content** targeting long-tail keywords (e.g., "How TRM Training Helps Educators").

3. Leverage Paid Search for High-Intent Audiences

- **Problem:** Paid search contributes only **17 new users**, suggesting underutilization.
- **Solution:**
 - Run **Google Ads campaigns** targeting high-intent keywords (e.g., "CRM training near me," "TRM certification cost").
 - Use **geo-targeting** to focus on the U.S. (where 87% of users are located) and test ads in secondary markets (UK, Canada).
 - Retarget users who visited training pages but didn't convert.

4. Improve Demographic Data Collection

- **Problem:** 80% of age data and 77% of gender data are "unknown," limiting targeting.
- **Solution:**
 - Implement **optional demographic surveys** (e.g., pop-ups offering a free resource in exchange for age/gender info).
 - Use **Google Analytics 4 (GA4) enhanced tracking** to capture more user attributes.

5. Boost Engagement via Email and Social Media

- **Problem:** Email and organic social drive minimal traffic (10 and 84 sessions, respectively).
- **Solution:**
 - Launch a **monthly newsletter** featuring training updates, success stories, and CTAs to high-traffic pages.
 - Repurpose top-performing content (e.g., TRM explainer videos) for **LinkedIn, Instagram, and Facebook**.
 - Partner with influencers in trauma care to amplify reach

Limitations & Future Work

Challenges Faced:

1. **Data Gaps:** Limited demographic data (e.g., "unknown" age/gender) due to privacy settings or tracking limitations.
2. **Conversion Tracking:** Unable to analyze full conversion paths (e.g., why users abandon forms).
3. **Time Constraints:** Data covered only 3 months (Feb–Apr), limiting long-term trend analysis.

Key Takeaways for Future Projects:

- **Invest in better tracking:** Use **UTM parameters** for campaigns and set up **GA4 conversion events**.
- **Expand data sources:** Incorporate **heatmaps (Hotjar)** and **user feedback surveys** to understand behavior.
- **Focus on retention:** Analyze returning users' behavior to improve loyalty (e.g., email drip campaigns).

By implementing these recommendations, TRI can **increase conversions, diversify traffic sources, and better serve its core audience** (U.S.-based females aged 25–44). Future work should explore **multilingual content** to engage non-English speakers and **mobile optimization** given the younger audience (18–24).

Conclusion

In conclusion. The report of TRI's analyzation of their website showed high user volume in the few months the data was gathered. The data showed, majority of users are U.S based, female between the ages of 25-44, not to mention the other ages that should be investigated further. However, the conversion rate was not accessible to us but, with these findings, TRI can use this data to enhance CTA, improve user interface and optimize landing pages to increase an average time on landing pages. By focusing on the recommendations, TRI will have no trouble in promoting their CRM and TRM trainings.
